PRIOR ART

#### SPECIFICATION

## ORAL PHARMACEUTICAL COMPOSITION

#### RELATED APPLICATION

The present application claims priority from Japanese Patent Application No. 290341/99 filed on October 12, 1999 the disclosure of which is incorporated herein by reference.

FIELD OF THE INVENTION

The present invention relates to an oral pharmaceutical composition, which rapidly disintegrates or becomes dissolved or suspended in the mouth during administration or upon addition of water before use.

Oral formulations require compliance with a dosage regimen and thus need to be designed to secure compliance.

15 Especially for children and seniors who have less capacity to swallow, ease of swallowing is an important factor.

Oral formulations suitable for children and seniors include oral granular formulations such as granules, powders and fine granules. Oral granular formulations are

characterized in that they are smaller than tablets and capsules, which makes them easier to swallow, and also to adjust their dose. Solutions have similar advantages. However, active ingredients supplied in solutions are limited because such ingredients need to be stable in an aqueous solution. Recently, fast-disintegrating tablets

which rapidly disintegrate in the mouth have been proposed. However, it is difficult to adjust the dose in relation to such tablets in spite of their excellent handling

properties. Therefore, oral granular formulations are desirable for use in children and seniors to treat various kinds of diseases.

Oral granular formulations are actually administered

1) directly via oral route, optionally with water just
following administration, or 2) after being dissolved or
suspended in water or the like, or 3) per tubam via a
catheter or the like after being dissolved or suspended in
water or the like.

In the cases of 1) and 2), rejection by patients of 10 dosing must be avoided especially by children. rejection is caused by not only taste and odor but also an sensation to the tongue during administration. any presence of insufficiently disintegrating masses may 15 give rise to oral or guttural discomfort on account of which children are liable to reject a second or subsequent In seniors, insoluble or sparingly soluble particles may enter the gaps between false teeth to cause pain if oral granular formulations poorly disintegrate. 20 decreases patient compliance and jeopardizes treatment with the proper dosage regimen. In the cases of 2) and 3), rapid dissolution or suspension would be desirable in the field of therapy, and in the case of 3), slow-dissolving or less soluble ingredients in compositions are undesirable 25 since they may cause clogging of tubes.

Thus, while disintegration and dissolution are important properties for oral granular formulations, the design of fast-disintegrating or -dissolving oral granular

15

20

25

formulations has not been achieved sufficiently.

Oral granular formulations also suffer from problems with respect handling properties, such as deposition to packing sheets or containers or scattering in the case of powdery formulations having a small particle size.

Therefore, appropriately granulated formulations less prone to such problems would be preferred. In addition, oral granular formulations are commonly prepared by adding binders during the granulation process. To granulate mixed powders having low granulation properties, it is necessary to select binders having a high binding power or to use a large amount of binders. This improves granulation, but the resulting granules are hard and generally poor in disintegration or dissolution qualities, and are thus not suitable for oral granular formulations.

## SUMMARY OF THE INVENTION

Thus, the inventors studied carefully the development of a widely applicable technique for use in preparing oral granular formulations; with the resulting formulations having good handling properties, and able to rapidly disintegrate or dissolve, either in the mouth during administration, or when they are dissolved or suspended before use. As a result, the inventors accomplished the present invention on the basis of the finding that oral granular formulations showing rapid disintegration or dissolution in the mouth during administration or when they are dissolved or suspended before use can be prepared by granulation with sucrose with a reduced amount of binders.

15

## DETAILED DESCRIPTION OF THE INVENTION

Accordingly, the present invention relates to fast-disintegrating oral pharmaceutical compositions granulated with sucrose. According to the present invention, oral granular formulations can be prepared with a reduced amount of binders to provide fast-disintegrating or fast-dissolving oral granular formulations. According to the present invention, it is possible to further improve oral granular formulations, and thuspatient compliance, by incorporating other additives for improving organoleptic properties or stability of active ingredients when the oral granular formulation is required to contain sucrose as a sweetening agent such as a dry syrup.

The fast-disintegrating oral pharmaceutical composition of the present invention can be prepared by granulating a mixture of an active ingredient, sucrose and optionally other additive(s).

The pharmaceutical composition of the present invention is described in detail below.

The amount of sucrose added into the composition of the present invention is not specifically limited so far as it is within a range that allows granulation, but is selected appropriately from a range satisfying pharmaceutically desirable properties, depending on the nature or amount of active ingredients or other ingredients. The amount of sucrose required to be used to obtain good granules is preferably 30% by weight or more of the total composition.

Suitable active ingredients for use in the present invention are not specifically limited so far as they can be administered as oral granular formulations. Examples are drugs for circulatory diseases such as pilsicainide hydrochloride, molsidomine, vinpocetine, propranolol, methyldopa, dipyridamole, furosemide, triamterene, nifedipine, atenolol, spironolactone, metoprolol, pindolol, captopril, isosorbide dinitrate; drugs for central nervous system disorders such as diazepam, idebenone, aspirin, 10 ibuprofen, paracetamol, naproxen, piroxicam, diclofenac, indomethacin, sulindac, lorazepam, nitrazepam, phenytoin, acetaminophen, ethenzamide, ketoprofen; drugs for gastrointestinal disease such as cimetidine, ranitidine, pancreatin, 5-aminosalicylic acid, lansoprazol; drugs for respiratory diseases such as amlexanox, dextromethorphan, 15 theophyline, pseudoephedrine, salbutamol, guaifenesin; antibiotics and chemotherapeutics such as cefalexin, cefaclor, cefradine, amoxicillin, pivampicillin, bacampicillin, dicloxacillin, erythromycin, erythromycin 20 stearate, lincomycin, doxycycline, trimethoprim, sulfamethoxazole and compound 1 below; drugs for metabolic disorders such as serrapeptase, glibenclamide, potassium chloride; vitamin drugs such as vitamin B1, vitamin B2, vitamin B6, vitamin C, fursultiamine. These compounds may 25 be used as salts with alkali metals or alkali earth metals such as sodium, potassium, calcium or magnesium; amino acids such as lysine; ammonium; inorganic acids such as

hydrochloric acid or nitric acid; or organic acids such as

acetic acid or citric acid; or solvates such as hydrates so far as they are safe such that orally non-toxic and are pharmaceutically acceptable.

When the pharmaceutical composition of the present

invention is required to be water-soluble, active
ingredients can be selected appropriately from watersoluble compounds. As used herein, the description "watersoluble compounds" includes very soluble, freely soluble or
sparingly soluble compounds as defined in the general

notices of the 12th edition of the Japanese Pharmacopoeia,
i.e., compounds that require less than 100 ml of water to
dissolve 1 g or 1 ml of solute.

The pharmaceutical composition of the present invention can be used preferably in solution or syrup when the active ingredient is unstable in water, due to the ability to be use other additives. As a preferred embodiment, the present invention is applied to penem compounds that are typically unstable in water.

Penem compounds are non-natural β-lactam compounds

the design of which is based on the concept of fusing the structures of penicillin and cephalosporin (for example, see Woodward, R. B., In Recent Advances in the Chemistry of β-Lactam Antibiotics, Elks, J., Ed., The Chemical Society, London, 1977, Spec. No. 28, pp. 167-180; Japanese Patent

Public Disclosure (Kokai) Nos. 207387/86, 162694/88, 222486/85 and 119486/79). They are a novel type of antibiotics having both the wide antibacterial spectrum and high safety of penicillin and cephem antibiotics belonging

to  $\beta\text{-lactam}$  antibiotics, as well as the potent antibacterial activity and high  $\beta\text{-lactamase}$  stability of carbapenem antibiotics.

Among penem compounds, tablets of sodium (+)-(5R)6S)-6-[(R)-1-hydroxyethyl]-7-oxo-3-[(R)-2tetrahydrofuryl]-4-thia-1-azabicyclo [3.2.0] hept-2-ene-2carboxylate 5/2 hydrate (faropenem sodium, hereinafter referred to as compound 1) are currently used as therapeutic agents for infectious diseases. Compound 1 is 10 reported to show potent antibacterial activity against not only methicillin-sensitive Staphylococcus aureus (MSSA), Streptococcus pyrogenes and Streptococcus pneumoniae but also gram-positive bacteria for which conventional  $\beta$ -lactam drugs were not effective such as penicillin-resistant 15 pneumococci (PRSP), oral staphylococci and enterococci and also show a wide antibacterial spectrum covering gramnegative bacteria such as Haemophilus influenzae and anaerobic bacteria such as the genus Bacteroides because of its novel skeleton penem ring (Kagaku Ryoho no Ryoiki (The 20 Field of Chemotherapy), Vol. 13, No. 10, pp. 74-80, 1997). This compound is also reported to have potent antibacterial activity against pathogenic bacteria of periodontis such as Porphyromonas gingivalis (CHEMOTHERAPY, Vol. 42, S-1, pp. 38-50, 1994) as well as potent antibacterial activity 25 against bacterial strains from dental infectious diseases which have recently become increasingly resistant (Journal of Japanese Society of Chemotherapy, Vol. 45, No. 11, pp. 965-971, 1997).

15

20

Penem compounds used in the present invention are not specifically limited so far as they have antibacterial activity and safety such as non-immunogenicity and oral non-toxicity and are pharmaceutically acceptable. A specific example is compound 1 above. Compound 1 may be substituted at 3-position by 1,4-dioxane-2-yl, ethylsulfanyl, 3-tetrahydrofurylmethyl, methoxymethyl, ((aminocarbonyl)oxy)methyl, (4R)-pyrrolidine-2-thione-4-ylthio and other groups. These compounds may also be used as salts thereof with alkali metals or alkali earth metals such as sodium, potassium, calcium or magnesium, or amino acids such as lysine, or ammonium, and may also be used as solvates such as hydrates.

When it is desired that the pharmaceutical composition of the present invention be soluble in water, penem compounds as active ingredients can be appropriately selected, taking their water solubility into account.

The amount of an active ingredient in the composition can be determined appropriately depending on the nature of the drug, the disease to be treated or other factors. When compound 1 is used, it is incorporated at about 2-20% by weight as a free anhydride on the basis of the total composition.

The dose of thus obtained formulation containing a

25 penem compound, for example, is typically 50-1500 mg

(potency), preferably about 100-1000 mg (potency) daily per

adult (60 kg) depending on the disease to be treated,

conditions, age and other factors. For children, the dose

15

20

25

can be calculated on the basis of body weight.

According to the present invention, it provides a pharmaceutical composition with excellent disintegrating or dissolving properties, and may optionally contain various additives selected to improve pharmaceutically necessary general properties such as stability or ease of handling or conditions necessary to improve compliance such as palatability, odor and color. For example, such additives include (1) excipients such as lactose, starch, microcrystalline cellulose, D-mannitol, glucose and calcium phosphate; (2) disintegrating agents such as starch or sodium carboxymethylcellulose; (3) sweetening agents or corrigents such as D-mannitol, D-sorbitol, aspartame and citric acid; (4) plasticizers such as polyethylene glycol; (5) stabilizers such as polyaminocaroboxylic acid chelating agents such as EDTA and salts thereof, sodium pyrosulfite, 1-ascorbic acid; (6) preservatives such as paraoxybenzoate ester or benzalkonium chloride, as well as colorants and flavoring agents. The nature and amount of these additives can be appropriately determined depending on the desired pharmaceutical characteristics such as stability or taste of active ingredients. When the pharmaceutical composition of the present invention is desired to be soluble in water, additives can be appropriately selected, taking their water solubility into account.

Pharmaceutical compositions of the present invention can optionally further contain binders such as hydroxypropylcellulose or polyvinylpyrrolidone in an amount

15

20

25

in water.

that does not impair rapid disintegration or dissolution of oral granular formulations. In order to ensure rapid disintegration or dissolution, a binder having a low binding ability is used preferably in an amount of 5% by weight or less, especially 2% by weight or less on the basis of the weight of the compositions.

The oral pharmaceutical composition of the present

invention can be prepared by any of the known conventional processes for preparing oral granular formulations. Suitable conventional granulation processes are ones such as extruding granulation, agitating granulation, rolling granulation, fluidized bed granulation, comminuting granulation, crushing granulation, among which fluidized bed granulation is especially preferred because it facilitates preparation of granules characterized by 1) high porosity, 2) low bulk density and 3) good dispersion

According to the present invention, oral granular formulations such as granules, powders and fine granules can be prepared. These formulations can not only be administered orally as granules but also be dissolved or suspended in an aqueous solvent before use. As used herein, formulations for which it is desired to be dissolved or suspended before use means formulations that are shipped in a solid form but dissolved or suspended after opening the package before application. Normally, they are dissolved or suspended immediately before application.

A useful dosage form of oral granular formulations is

15

a dry syrup which is a type of syrup but dissolved or suspended before use. Dry syrup is preferred for the reason that a bitter or unpleasant taste of drugs is masked by a sweetening effect of sugars and various flavoring agents, and that palatability is improved by the use of suitable colorants, giving a pleasant color tone or the like. Dry syrups can be dissolved or suspended before use in not only water but also an aqueous liquid such as juice or milk. Thus, the pharmaceutical composition of the present invention showing rapid disintegration when water is added can be preferably embodied in dry syrups which are required to be easy to take even for seniors and children.

The present invention also includes as preferred embodiments, oral granular formulations similar to dry syrups such as granules, powders and fine granules which contain a substantial amount of sucrose, and thus are suitable for being dissolved or suspended before use.

When oral granular formulations such as granules, powders and fine granules, especially dry syrups are

20 dissolved or suspended before use in hospitals, for example, they are often combined with water and left to stand before being taken by inpatients. Also, at home, dry syrups are mostly taken in divided portions after being combined with water. In the case that suspensions are allowed to stand,

25 insoluble ingredients precipitate thereby having a deleterious effect on the homogeneity of active ingredients, leading to improper dosing.

When insoluble ingredients exist in compositions, an

15

20

25

sensation on the tongue may cause children to reject doses. In seniors, insoluble ingredients may enter the gaps between false teeth to cause pain. Such effects decrease patient compliance and jeopardize treatment with the proper dosage regimen. For per tubam administration via a catheter or the like, insoluble ingredients may cause clogging of tubes. Therefore, insoluble ingredients in suspensions should be kept as low as possible; and, hence, the provision of oral granular formulations comprising components which are all homogeneously soluble, is highly desirable.

The pharmaceutical composition of the present invention can provide oral granular formulations which form homogeneously clear solutions when dissolved in water, because sucrose has a very good water solubility. Dry syrups which are homogeneously soluble in water are one of the preferred embodiments of the present invention.

As used herein, the description "dry syrups soluble in water" means those which become clear without leaving any trace of insoluble ingredients when they are combined with an appropriate amount of water. Generally, the amount of water in which dry syrups are dissolved or suspended is determined appropriately taking into account (1) the influence of the concentration on the stability of active ingredients, (2) ease of handling in the field of medication, and (3) ease of consumption by patients. For example, Josamy Dry Syrup (Yamanouchi Pharmaceutical) and Erythrocin Dry Syrup W (Dainippon Pharmaceutical) among

15

20

25

commercially available dry syrups are used as suspensions at concentrations of 30, 40 and 100 mg (potency)/mL in accordance with the instructions of the package inserts. The pharmaceutical compositions of the present invention can be used as a dry syrup homogeneously soluble in water within a wide concentration range of active ingredients, specifically at a concentration of 5-200 mg (potency)/mL, for example, 40 mg (potency)/mL for antibiotic formulations.

Preferred examples of a dry syrup include antibiotic formulations. Especially, it would be highly desirable if penem compounds having high safety and potent antibacterial activity as described above could be formulated into a dry syrup which is solid until immediately before use, and which ensures proper compliance for children and seniors with easy adherence to a proper dosage regimen, because they are chemically unstable and susceptible to hydrolysis similarly to other  $\beta$ -lactam compounds. Penem compounds generally have a poor stability in the presence of a compound having a proton-donating group such as sugars and organic acids, and it has been difficult to ensure stability of penem compounds in solution and thus the need for their formulation in a dry syrup has not been met

According to the present invention, it is possible to provide oral granular formulations in the form of a dry syrup which contains a penem compound such as compound 1 as an active ingredient, and yet which exhibits rapid disintegration, dissolution or suspension and stability.

According to the present invention, oral granular

15

20

25

formulations with excellent disintegrating or dissolving properties can be provided optionally by adding further various additives with the aim of improving stability after dissolution or suspension or stability in the solid state.

Thus, various additives were carefully examined with a view to ensuring the stability of the pharmaceutical composition of the present invention containing a penem compound, such as compound 1, as an active ingredient. As a result, it was found surprisingly that the stability of penem compounds both in aqueous solution and solid state can be improved by adding D-mannitol among various sugars that generally destroy the stability of compound 1. Therefore, the present invention provides stable dry syrups containing a penem compound as an active ingredient and having fast-disintegrating or -dissolving properties.

The amount of D-mannitol also serving as an excipient and a sweetening agent in the composition of the present invention is not specifically limited, but can be appropriately selected from a range that ensures the stability of active ingredients both in water and in a solid state and imparts pharmaceutically desirable properties to the compositions. In order for the pharmaceutical composition to be water-soluble, the amount of D-mannitol is preferably 30% by weight or less of the total weight of the compositions when it is desired that formulations having an indicated potency of 10% become clear at a concentration of active ingredients of 40 mg (potency)/ mL. Compositions containing compound 1 as an

active ingredient preferably contain D-mannitol in an amount of 5% by weight or more of the total weight of the compositions with regard to stability after being dissolved in water.

## 5 EXAMPLES

The following examples further illustrate the present invention without, however, limiting the scope of the invention thereto.

## Example 1

The influence of sucrose on granulation and 10 disintegration of oral granular formulations was evaluated. About 200 g of each of mixed powders consisting of compound 1 and sucrose in the ratios shown in Table 1 was blended in a fluidized bed granulator (New Marumerizer NQ-LABO from 15 Fuji Paudal) for 2 minutes (product temperature: 24°C, inlet air flow: dial setting 4-5, inlet air pressure: 50-100 mmAq). The mixture was granulated for 40-60 minutes while it was sprayed with water at a rate of 1.0-1.4 g/min (product temperature: 24°C, inlet air temperature: 30-40°C, 20 inlet air flow: dial setting 4-5, inlet air pressure: 50-100 mmAq). Then, the granules were dried in the same apparatus for 5-10 minutes (product temperature: 24-30°C, inlet air temperature: 30-40°C, inlet air flow: dial setting 4-5, inlet air pressure: 50-100 mmAq). 25 granules were removed and screened through a sieve No. 30 (500 μm) into 5 classes of granules.

By assessing the proportion of fine powder, completion of granulation of the resulting 5 classes of

15

20

25

granules was evaluated based on one of the definitions for fine granules provided in the 12th edition of the Japanese Pharmacopoeia. That is, granulation was judged to be good when the proportion of fine powder passing through a sieve No. 200 (75  $\mu$ m) is 10% by weight or less than the total weight. The sieve was operated according to the method described in the 12th edition of the Japanese Pharmacopoeia.

As a result, granules containing sucrose at a proportion of 30% by weight or more (samples 1-3) showed good granulation among these formulations consisting of sucrose and compound 1 (Table 1).

The three classes of granules showing good granulation were evaluated for disintegration by simulating an environment where the amount of water is not sufficient such as the inside of the mouth. That is, a ring having a diameter of 12 mm and a height of 20 mm was mounted on a filter paper impregnated with water, about 0.5 g of granules were placed in the ring and the appearance of the granules was observed after 2 minutes. As a result, all of the three classes of granules showed rapid disintegration irrespective of the ratio of sucrose (Table 1).

Thus, it was found that the pharmaceutical composition of the present invention granulated with sucrose shows good granulation without using binders. It was also found that varying amounts of sucrose do not affect rapid disintegration of oral granular formulations. For the pharmaceutical composition containing compound 1 as an active ingredient without any other ingredients, good

granulation was shown when 30% by weight or more of sucrose was added.

Table 1

Sample No.		1	2	3	4	5
Composition	Compound 1	10.0	50.0	70.0	80.0	90.0
(% by weight)	Sucrose	90.0	50.0	30.0	20.0	10.0
Evaluation of granulation*		0	0	0	x	x
Evaluation of disintegration**		0	0	0	-	-

- \* o means that the proportion of fine powder of 75 µm or less is 10% by weight or less, and x means that the proportion of fine powder of 75 µm or less exceeds 10% by weight.
- \*\* o means that any granular shape is not found 2 minutes
  after 0.5 g of each sample is placed in a ring (diameter 12
  mm, height 20 mm) mounted on a filter paper impregnated
  with water.
  - \*\* not evaluated.

## Example 2

15 Pharmaceutical compositions containing excipients as other additives were prepared and the influence of sucrose on granulation and disintegration was evaluated. Five classes of granules shown in Table 2 were prepared by the same procedure as in Example 1 and granulation and disintegration were evaluated.

As a result, 3 classes of granules (samples 6-8)

containing sucrose showed good granulation and rapid disintegration. However, granules not containing sucrose (samples 9, 10) showed insufficient granulation (Table 2). Thus, it was found that oral granular formulations containing at least 30% by weight of sucrose show improved granulation and excellent disintegration as compared with those not containing sucrose.

Table 2

Sample No.		6	7	8	9	10
Composition	Compound 1	10.0	10.0	10.0	10.0	10.0
(% by weight)	Sucrose	30.0	30.0	30.0	-	-

- \* o means that the proportion of fine powder of 75  $\mu m$  or less is 10% by weight or less, and x means that the proportion of fine powder of 75  $\mu m$  or less exceeds 10% by weight.
  - \*\* o means that any granular shape is not found 2 minutes after 0.5 g of each sample is placed in a ring (diameter 12 mm, height 20 mm) mounted on a filter paper impregnated with water.
  - \*\* not evaluated.

## Example 3

15

15

20

25

Pharmaceutical compositions containing binders as other additives were evaluated for the influence of sucrose on granulation and disintegration. About 200 g of each of mixed powders having the compositions shown in Table 3 except for hydroxypropylcellulose was blended in a fluidized bed granulator (New Marumerizer NQ-LABO from Fuji Paudal) for 2 minutes (product temperature: 24°C, inlet air flow: dial setting 4-5, inlet air pressure: 50-100 mmAq). The mixture was granulated for about 40-120 minutes while it was sprayed with an aqueous hydroxypropylcellulose solution (sample 11) or water (sample 12) at a rate of 1.0-1.4 g/min (product temperature: 24°C, inlet air temperature: 30-40°C, inlet air flow: dial setting 4-5, inlet air pressure: 50-100 mmAq). Then, the granules were dried in the same apparatus for 5-10 minutes (product temperature: 24-30°C, inlet air temperature: 30-40°C, inlet air flow: dial setting 4-5, inlet air pressure: 50-100 mmAq). The granules were removed and screened through a sieve No. 30 (500  $\mu$ m) into 2 classes of granules. resulting granules were evaluated with regard to granulation and disintegration by the method above.

As a result, granules containing 10% by weight of a binder but not sucrose (sample 11) showed good granulation, but extremely poor disintegration. In contrast, granules in which sucrose was used in place of the binder for improving disintegration (sample 12) exhibited rapid disintegration while maintaining good granulation (Table 3). Thus, it was found that the addition of 10% by weight of

sucrose can reduce the amount of binders, which are a main cause of delayed disintegration, while ensuring good granulation.

Table 3

Sample No.		11	12
Composition	Compound 1	10.0	10.0
(% by weight)	Sucrose	0.0	10.0
	Lactose	80.0	80.0

Evaluation of granulation*		0	0
Evaluation of disintegration**		х	0

- 5 \* o means that the proportion of fine powder of 75  $\mu m$  or less is 10% by weight or less, and x means that the proportion of fine powder of 75  $\mu m$  or less exceeds 10% by weight.
- \*\* o means that any granular shape is not found 2 minutes

  10 after 0.5 g of each sample is placed in a ring (diameter 12 mm, height 20 mm) mounted on a filter paper impregnated with water.

## Example 4

Oral granular formulations having the compositions shown in Table 4 were prepared. Namely, compound 1, sucrose and D-mannitol were mixed in a fluidized bed granulator (STREA-I from Powrex) for about 15 minutes (outlet air temperature: 30-34°C, inlet air flow: 20 m³/hr).

15

20

25

The mixture was granulated for about 30 minutes while it was sprayed with water at a rate of 3.0-4.0 g/min (outlet air temperature: 31-32°C, inlet air flow: 10-40 m³/hr). Then, the granules were dried in the same apparatus for about 30 minutes (outlet air temperature: 34-37°C, inlet air flow: 20 m³/hr). The granules were removed and screened through a sieve No. 30 (500  $\mu$ m) into 2 classes of granules. A glass bottle containing 3 g of the resulting granules was tightly sealed and stored at 60°C for 12 days to determine the content of compound 1.

The content of compound 1 in the samples was determined by high-performance liquid chromatography as follows. A stainless steel high-performance liquid chromatography column packed with octadecylsilyl silica gel was used. The column temperature was set at 40°C. The mobile phase consisted of a mixed solution of 840 mL of a solution containing 45 mM potassium dihydrogenphosphate, 5 mM sodium monohydrogenphosphate and 5 mM tetra-n-butylammonium bromide and 160 mL of acetonitrile. The flow rate was controlled to give the retention time of compound 1 of 11 minutes. For detection, a UV absorption spectrophotometer was used at a wavelength of 305 nm.

As a result, granules not containing D-mannitol (sample 13) showed a yellowish appearance after storage and the residual retention to the initial potency of compound 1 was 83.0%. However, granules containing 5% by weight of D-mannitol (sample 14) was less colored than sample 13 and the residual retention to the initial potency was 91.1%,

i.e., higher than that of sample 13 (Table 4). This showed that the addition of at least 5% by weight of D-mannitol in the solid state has the effect of improving the stability of compound 1 in oral granular formulations of the present invention.

Table 4

Sample No.		13	14
	Compound 1	123.5	123.5
Composition (mg)	Sucrose	876.5	826.5
	D-mannitol	0	50
Stability test results	Initial appearance	White granules	White granules
	Appearance after storage at 60°C/12 days	Yellow granules (aggregated)	Pale yellow granules (aggregated)
	Potency retention (%) after storage at 60°C/12 days	83.0	91.1

## Example 5

The influence of D-mannitol on the stability of

compound 1 in aqueous solution containing sucrose was
evaluated. An aqueous solution of each of the mixed
powders having the formulations shown in Table 5 was
prepared at a concentration of compound 1 of 49.4 mg/mL
(40.0 mg (potency)/mL). A glass bottle containing 5 mL of

the resulting aqueous solution was tightly sealed and
stored at 25°C for 7 days to determine the content of
compound 1. The content of compound 1 was determined by

15

20

the HPLC method above.

As a result, the residual retention to the initial potency in a sample not containing D-mannitol (sample 15) after storage at 25°C for 7 days was 83.5%. However, the residual retentions to the initial potencies in all the samples containing 4.9 - 29% by weight of D-mannitol (samples 16-19) were about 90% (Table 5). This showed that D-mannitol has the effect of improving the stability of compound 1 in aqueous solution containing sucrose. Thus, it was found that pharmaceutical compositions of the present invention containing compound 1, a water-labile penem compound, as an active ingredient can be made sufficiently stable in a solution or dispersion in water by incorporating about 5% by weight or more of D-mannitol based on the weight of the compositions.

Table 5

Sample No.		15	16	17	18	19
Composition	Compound 1	49.4	49.4	49.4	49.4	49.4
(mg/ml)	Sucrose	360	340	320	280	240
	D-mannitol	0	20	40	80	120
Stability test results	Potency retention (%) after storage at 25°C/7 days	83.5	89.3	91.2	91.6	92.0

## Example 6

The following test was performed for the purpose of obtaining an approximate measure of the upper limit of the amount of D-mannitol to be added to oral granular

25

formulations of the present invention of the type used as pharmaceutical compositions for which it is required to be soluble in water.

Each of mixed powders having the formulations shown

in Table 6 was dissolved or suspended in water at a
concentration of compound 1 of 49.4 mg/ml (40.0 mg
(potency)/mL) to evaluate the appearance (liquid
appearance) of the aqueous solution or suspension. As a
result, a formulation containing 29.3% by weight of Dmannitol based on the weight of the composition (sample 20)
was completely dissolved to become clear. However,
formulations containing 34.2% by weight (sample 21) and
39.1% by weight (sample 22) of D-mannitol were found to
leave an insoluble ingredient (Table 6). This insoluble
ingredient was determined to be D-mannitol as was also
indicated by the documentary saturation solubility.

Thus, oral granular formulations of the present invention should desirably contain D-mannitol in an amount of about 30% by weight or less based on the weight of the compositions when they are pharmaceutical compositions which are to be soluble in water. However, the amount of D-mannitol contained in oral granular formulations of the present invention can be appropriately increased when they are dissolved in a larger amount of water than indicated above or when they are acceptable as a suspension.

10

20

Table 6

Sample No.		20	21	22
	Compound 1	49.4	49.4	49.4
Composition (mg/ml)	Sucrose	240	220	200
	D-mannitol	120	140	160
Liquid appearance		Clear	Suspension	Suspension

## Example 7: Preparation of dry syrups

[Preparation examples 1-3 of dry syrup]

Dry syrups having the compositions shown in Table 7 were prepared by the fluidized bed granulation process. Namely, compound 1, sucrose, D-mannitol and magnesium aluminometasilicate (for sample 24) were mixed in a fluidized bed granulator (STREA-I from Powrex) for about 15 minutes (outlet air temperature: 30-34°C, inlet air flow: 20 m<sup>3</sup>/hr). The mixture was granulated for about 30 minutes while it was sprayed with an aqueous solution separately prepared by dissolving hydroxypropylcellulose (for samples 23 and 24) and banana flavor in water at a rate of 3.0-4.0 g/min (outlet air temperature: 31-32°C, inlet air flow: 10-15 40 m³/hr). After completion of granulation, the granules were dried in the same apparatus for about 30 minutes (outlet air temperature: 34-37°C, inlet air flow: 20 m³/hr). The granules were removed and screened through a sieve No. 30 (500  $\mu$ m) into 3 white dry syrups. The resulting dry syrups were subjected to pharmaceutical evaluations.

Particle size distribution analysis of each dry syrup

15

showed that the proportion of fine powder of 75 µm or less was 10% by weight or less in all the samples, verifying good granulation of the dry syrup irrespective of the presence or absence of binders. All the dry syrups also showed rapid disintegration as evaluated by the method above. When purified water was added to these dry syrups at a concentration of compound 1 of 49.4 mg/mL (40.0 mg (potency)/mL), all of them rapidly disintegrated so that the dry syrup containing an insoluble matter magnesium aluminometasilicate (sample 24) formed a white suspension while the other two dry syrups (samples 23 and 25) formed colorless clear aqueous solutions (Table 7).

Thus, it was found that pharmaceutical compositions of the present invention in the form of a dry syrup show good granulation and rapidly disintegrate into solution or suspension. It was also found that dry syrups which are homogeneously soluble in water can be provided by appropriate selections of the composition of additives.

Liquid appe		Colorless clear	White suspension	Colorless clear

<sup>\*</sup> o means that any granular shape is not found 2 minutes after 0.5 g of each sample is placed in a ring (diameter 12 mm, height 20 mm) mounted on a filter paper impregnated with water.

[Preparation example 4 of dry syrup]

10 A dry syrup having the composition shown in Table 8

<sup>\*\*</sup> Liquid appearance was observed when 4 g of each sample was dissolved or dispersed in 10 ml of water.

2.5

pharmaceutical evaluations.

was prepared by the fluidized bed granulation process. Namely, about 4.9 kg of a mixed powder consisting of compound 1, sucrose and D-mannitol was blended in a fluidized bed granulator (New Marumerizer NQ-230 from Fuji Paudal) for 2 minutes. The mixture was granulated for about 50 minutes while it was sprayed with a binder solution separately prepared by dissolving hydroxypropylcellulose and colorant Yellow No. 5 in water. Subsequently, the mixture was sprayed with a flavoring 10 solution of orange flavor diluted in ethanol for about Then, the granules were dried in the same 10 minutes. apparatus for about 10 minutes. The granules were removed and screened through a sieve No. 30 (500 µm) into an orange dry syrup. The resulting dry syrup was subjected to

Particle size distribution analysis of this dry syrup showed that the proportion of fine powder of 75 µm or less was 5.4% by weight, verifying good granulation of this composition. This dry syrup also showed rapid disintegration as evaluated by the method above. When

disintegration as evaluated by the method above. When purified water was added at a concentration of compound 1 of 49.4 mg/mL (40.0 mg (potency)/mL), this dry syrup rapidly disintegrated and rapidly dissolved into a clear orange solution (Table 8).

The stability after dissolved in water was also evaluated. A glass bottle containing 5 mL of an aqueous solution of this dry syrup dissolved in water at a concentration of compound 1 of 49.4 mg/mL (40.0 mg

(potency)/mL) was tightly sealed and stored at 10°C for 28 days to determine the appearance of the liquid and the content of compound 1. The content of compound 1 in the composition was determined by the method above.

As a result, no change was observed in liquid appearance before and after storage at 10°C for 28 days. The residual retention to the initial potency after storage was 94.2% (Table 8). Thus, this dry syrup containing D-mannitol showed good stability after dissolved in water.

Table 8

Sample No.		26
Composition	Compound 1	12.35
(% by weight)	Sucrose	55.85
	D-mannitol	29.75
	Hydroxypropylcellulose	2.00
	Colorant Yellow No. 5	0.05
	Orange flavor	trace
Appearance		Orange granules
Odor		Orange-like
Evaluation of g	ranulation by particle size	distribution (%)
	500 μm or more	0.2
	355-500 μm	11.3
	177-355 μm	72.5
	75-177 μm	10.6
	75 µm or less	5.4
Evaluation of d	isintegration*	0
Liquid appearan	Ce**	Clear orange
Stability test	results after dissolution	
	Initial liquid appearance	Clear orange
	Liquid appearance after 10°C/28 days	Clear orange
	Potency retention (%) after 10°C/28 days	94.2

<sup>\*</sup> o means that any granular shape is not found 2 minutes after 0.5 g of each sample is placed in a ring (diameter 12 mm, height 20 mm) mounted on a filter paper impregnated with water.

\*\* Liquid appearance was observed when 4 g of each sample was dissolved or dispersed in 10 ml of water.

Thus, it was confirmed that pharmaceutical

compositions of the present invention provide dry syrups
containing compound 1, a penem compound, as an active
ingredient, which have good granulation and rapid
disintegration, homogeneously dissolve in water into clear
solution and are stable after dissolved in water.

## CLAIMS

- 1. A fast-disintegrating oral pharmaceutical composition prepared by granulation with sucrose.
- 2. The oral pharmaceutical composition of Claim 1 containing a water-soluble drug as an active ingredient.
- 3. The oral pharmaceutical composition of Claim 1 or 2 containing a penem compound as an active ingredient.
- 4. The oral pharmaceutical composition of any one of Claims 1 to 3 containing faropenem sodium as an active ingredient.
- 5. The oral pharmaceutical composition of any one of Claims 1 to 4 prepared by the fluidized bed granulation process.
- 6. The oral pharmaceutical composition of any one of Claims 1 to 5 containing sucrose not less than 30% by weight based on the total weight of the composition.
- 7. The oral pharmaceutical composition of any one of Claims 1 to 6 in a dosage form to be dissolved or suspended before use.
- 8. The oral pharmaceutical composition of any one of Claims 1 to 7 in the form of a dry syrup.
- 9. The oral pharmaceutical composition of any one of Claims 1 to 8, which provides a clear solution when it is dissolved in water.
- 10. The oral pharmaceutical composition of any one of Claims 1 to 9 containing D-mannitol.
- 11. The oral pharmaceutical composition of any one of Claims 1 to 10 containing D-mannitol in the range of 5-30%

by weight of D-mannitol based on the total weight of the composition.

## ABSTRACT

with the purpose of developing a widely applicable technique capable of preparing oral granular formulations having good handling properties and rapidly disintegrating or dissolving in the mouth during administration or when they are dissolved or suspended before use, the present invention provides oral granular formulations containing no or little binders and having fast-disintegrating or - dissolving properties.
